Practical 1: Create a Maven Project
To Create a maven project we can create file structure manually or via “mvn” command-line

To create manually we need to make a file structure like this:

```
my-app1/
│
├── pom.xml
│
├── src/
│   ├── main/
│   │   ├── java/
│   │   │   └── com/
│   │   │       └── example/
│   │   │           └── myapp1/
│   │   │               └── App.java
│   │   │
│   │   ├── resources/
│   │   │   └── application.properties
│   │   │
│   │   └── webapp/            (only for web projects)
│   │       ├── WEB-INF/
│   │       │   └── web.xml
│   │       └── index.jsp
│   │
│   └── test/
│       ├── java/
│       │   └── com/
│       │       └── example/
│       │           └── myapp1/
│       │               └── AppTest.java
│       │
│       └── resources/
│
└── target/   (generated after build)
```

Or We can use command:
mvn archetype:generate -DgroupId=com.tech -DartifactId=my-app1
-DarchetypeArtifactId=maven-archetype-quickstart -DinteractiveMode=false

Explaintion:
1. mvn archetype:generate
mvn: This is the Maven command-line tool.
archetype:generate: This tells Maven to generate a project using a Maven archetype.
An archetype is a template for creating projects with a predefined structure
2. -DgroupId=com.example
-DgroupId: This specifies the group ID for the project.
com.example: The value of the groupId. This typically represents the organization or

company creating the project (e.g., a domain name in reverse order).

3.-DartifactId=my-app1
-DartifactId: This specifies the artifact ID for the project.
my-app1: The value of the artifactId. This is usually the name of your project and will be the base name of the generated .jar or .war file.
4. -DarchetypeArtifactId=maven-archetype-quickstart
-DarchetypeArtifactId: Specifies which Maven archetype to use for project creation.
maven-archetype-quickstart: The value of the archetypeArtifactId. This is a commonly used archetype that creates a simple Java project with a basic directory structure and a sample class.
5. -DinteractiveMode=false
-DinteractiveMode: Determines whether Maven should prompt you for input during the process.
false: Disables interactive mode, meaning Maven uses the specified options (groupId, artifactId, etc.) without prompting.
This command is used to quickly bootstrap a new Java project with Maven, giving you a starting
point for development.

```
sumitkumarmehta@sumits-MacBook-Air lemaven % mvn archetype:generate -DgroupId=com.demo -DartifactId=my-app1 -DarchetypeArtifactId=maven-archetype-quickstart -DinteractiveMode=false

sumitkumarmehta@sumits-MacBook-Air lemaven %
```

Project Built Successfull

As we can see the file structure it created
Now let's try to run hello world

A hello world code is pre-written in src->main->java->com here we can find App.java

mvn compile → it compiles main code
Note: It does not run test cases.
It only compile .java → .class and stores it in the target folder.

```
sumitkumarmehta@sumits-MacBook-Air my-app1 % mvn compile
